	Eucariotas (humanos, protozoos, animales y plantas)	Procariotas (arqueas y bacterias)
Núcleo		
Ubicación del ADN		
Forma de almacenamiento de ADN		
Cantidad de ADN no codificante		
Mitocondrias		
Ribosomas		
Membrana celular		
Pared celular		
Compartimentación		
Estructuras locomotoras (flagelo)		

Estableciendo Enlaces, los Átomos* forman Moléculas tanto en Vivos como en Inertes

En los Vivos, ciertas Moléculas se unen y forman Organelas que junto a Moléculas libres y al agua en que flotan, son envueltas por una Membrana constituyendo Células

FIGURE 2-1 Cross-sectional diagram of a hypothetical cell as seen with the light microscope. Individual organelles are expanded for closer examination. (Modified with permission from Bloom W, Fawcett DW: A Textbook of Histology, 9th ed. Philadelphia: Saunders; 1968)

Tipo de Unión	Función Principal	Características
Uniones estrechas (Zonula Occludens)	Sellan y mantienen la integridad epitelial.	Formadas por occludina, cadherinas y claudinas. Restringen el paso de moléculas entre las células y mantienen la polaridad celular.
Zonula Adherens	Adhesión celular y conexión con actina.	Formada por cadherinas. Conecta las células a filamentos de actina dentro de la célula.
Desmosomas	Proporcionan una fuerte adhesión entre células.	Formadas por cadherinas y conectadas a filamentos intermedios.
Hemidesmosomas	Conectan las células a la lámina basal.	Utilizan integrinas en lugar de cadherinas, conectándose a filamentos intermedios.
Adhesiones focales	Conectan las células a la lámina basal y participan en el movimiento celular.	Formadas por integrinas y asociadas a filamentos de actina. Participan en la dinámica del movimiento celular.
Uniones Gap	Permiten la comunicación directa entre células	Formadas por conexones, que son canales que permiten el paso de iones, azúcares, aminoácidos, etc. entre las células. Facilitan la señalización autocrina y paracrina.

La Membrana Plasmática o Celular posee Proteínas con dominios extra e intracelulares que interactúan con Moléculas de uno y otro lado

Un laberinto continuo de membranas y microtúbulos proteicos, comunican al ADN con el Extracelular

El que sean Proteínas las que efectivizan las órdenes del ADN, explica la cercanía Núcleo-REG. Parte de ellas, pasan al REL para que este cumpla sus roles, parte son transferidas por Vesículas al Golgi el que las introduce en Lisosomas o en Vesículas Secretorias que las vierten al Exterior

En la Membrana Celular, una Proteína es: **Bomba Iónica** si bombea iones, **Canal Iónico** si los deja pasar o salir, **Receptor** si recibe Mensajeros, **Transportador** si introduce moléculas no iónicas, **Enzima** si acelera Reacciones Químicas, **Inmune** si participa del reconocimiento de Antígenos y del reconocimiento de la célula como propia, **De Adhesión** si une células contiguas o **Estructural**, si es parte de su estructura

Órgano, aparato y sistema: estructura biológica y funcional del ser humano [Internet]. BlinkLearning Available from: <https://www.blinklearning.com/coursePlayer/clases2.php?idclase=65906540&idcurso=1160549>.

CIÓN INTERCELULAR

	GAP JUNCTIONS	SYNAPTIC	PARACRINE AND AUTOCRINE	ENDOCRINE
				
Message transmission	Directly from cell to cell	Across synaptic cleft	By diffusion in interstitial fluid	By circulating body fluids
Local or general	Local	Local	Locally diffuse	General
Specificity depends on	Anatomic location	Anatomic location and receptors	Receptors	Receptors

FIGURE 2-12 Na, K ATPase. The intracellular portion of the α subunit has a Na⁺-binding site (1), a phosphorylation site (4), and an ATP-binding site (5). The extracellular portion has a K⁺-binding site (2) and an ouabain-binding site (3). (Reproduced with permission from Horisberger JD, Lemas V,

FIGURE 2–11 Regulation of gating in ion channels. Ion channels can gate open or closed in response to several environmental signals. Some typical examples are shown in an idealized channel. (A) Ligand gating: Channel opens in response to ligand binding. (B) Voltage gating: Channel opens in response to a change in membrane potential. (C) Posttranslational modification: Channel gates in response to modification such as phosphorylation.

Descripción general de los receptores de neurotransmisores [6]

	Receptores ionotrópicos	Receptores metabotrópicos
Características	- Sitio de unión alostérico - La molécula <u>receptora</u> también es un <u>canal iónico</u> (canal unido).	- Mecanismos de <u>transducción de señales</u>, generalmente <u>proteínas G</u>, para activar eventos intracelulares utilizando un <u>segundo mensajero</u> - El <u>receptor</u> y el canal iónico son moléculas separadas.
Tiempo de apertura del receptor	Rápido	Lento
Respuesta	Potenciales postsinápticos de corta duración (PSP) o PSP rápidos	PSP postsinápticas o lentas de larga duración
Ubicación del efecto objetivo	Dentro de la región inmediata del <u>receptor</u>	Los efectos pueden ser más generalizados y persistentes en toda la <u>célula</u>.
Ejemplos de receptores	<u>Acetilcolina</u> nicotínica - GABA_A <u>Receptor 5-HT₃</u> <u>Glicina</u> <u>Glutamato</u>	<u>Glutamato</u> <u>Acetilcolina</u> muscarínica - GABA_B <u>Receptores de noradrenalina</u> y <u>epinefrina</u> α y β <u>Histamina</u> <u>Dopamina</u> - Neuropéptidos

B Metabotropic glutamate receptor

FIGURE 2–16 Heterotrimeric G proteins. **Top:** Summary of overall reaction that occurs in the G α subunit. **Bottom:** When the ligand (red oval) binds to the G protein–coupled receptor in the cell membrane, GTP replaces GDP on the α subunit. GTP- α separates from the $\beta\gamma$ subunit and GTP- α and $\beta\gamma$ both activate various effectors, producing physiologic effects. The intrinsic GTPase activity of GTP- α then converts GTP to GDP, and the α , β , and γ subunits reassociate.

TABLE 2–4 Examples of ligands for G protein–coupled receptors.

Class	Ligand
Neurotransmitters	Epinephrine
	Norepinephrine
	Dopamine
	5-Hydroxytryptamine
	Histamine
	Acetylcholine
	Adenosine
	Opioids
Tachykinins	Substance P
	Neurokinin A
	Neuropeptide K
Other peptides	Angiotensin II
	Arginine vasopressin
	Oxytocin
	VIP, GRP, TRH, PTH
	TSH, FSH, LH, hCG
Glycoprotein hormones	TSH, FSH, LH, hCG
Arachidonic acid derivatives	Thromboxane A ₂
Other	Odorants
	Tastants
	Endothelins
	Platelet-activating factor
	Cannabinoids
	Light

FSH, follicle-stimulating hormone; GRP, gastrin-releasing hormone; hCG, human chorionic gonadotropin; LH, luteinizing hormone; PTH, parathyroid hormone; TRH, thyrotropin-releasing hormone; TSH, thyroid-stimulating hormone; VIP, vasoactive intestinal peptide.

AGUA CORPORAL TOTAL

Polarity of Water (H₂O)

ChemistryLearner.com

PROPERTIES OF WATER

Structure

2 hydrogen atoms bond to oxygen atom, resulting in a bent shape

States of Matter

Melting Boiling

Melting Point = 0 °C Boiling Point = 100 °C

Solid (Ice) **Liquid (Water)** **Gas (Vapor)**

Density

	ρ (g/cm ³)
Solid	0.917
Liquid	0.997
Gas	0.6

The density is maximum (1 g/cm³) at 3.98 °C

Universal Solvent

Capable of dissolving many substances

Surface Tension

$\sigma = 0.072 \text{ Jm}^{-2}$

Forms a film that can resist an external force

Capillary Action

Moves up a thin air column against gravity

Polarity & Dipole Moment

$\mu = 1.855 \text{ D}$

Polar molecule due to the asymmetric shape

Heat of Vaporization

$\Delta H_v = 2260 \text{ J/g}$

Water Vapor Boiling Water Heat

Specific Heat

$c = 4.184 \text{ J/g} \cdot ^\circ\text{C}$

ChemistryLearner.com

FIGURE 1–2 Diagrammatic representation of osmosis. Water molecules are represented by small open circles, and solute molecules by large solid circles. In the diagram on the left, water is placed on one side of a membrane permeable to water but not to solute, and an equal volume of a solution of the solute is placed on the other. Water molecules move down their concentration (chemical) gradient into the solution, and, as shown in the diagram on the right, the volume of the solution increases. As indicated by the arrow on the right, the osmotic pressure is the pressure that would have to be applied to prevent the movement of the water molecules.
